A novel approach to H_2 extraction from liquid organic hydrocarbon carriers (LOHCs) using ultralow loading of Pt nanoparticles on a modified alumina structure with an ALD-titanium oxide shell is shown by Yongmin Kim et al. in their Research Article (e202417598). This unique catalyst design efficiently releases hydrogen from LOHCs, outperforming equivalent Pt and commercial catalysts. The ALD- TiO_2 shell enhances the catalytic activity while minimizing Pt usage.
